(Image credit: Blizzard) After a rocky launch week with frequent server issues (opens in new tab) and bloated player queues, Blizzard announced that more than 25 million Overwatch 2 players logged in in the first 10 days. game is reaching nearly three times the number of players per day than the original Overwatch's previous daily peak," the statement said. All the best Black Friday PC gaming deals are here. Usually, a hero this big isn't too amazing to launch a big free-to-play shooter, but the road to Overwatch 2 wasn't normal. Despite being labeled as a brand new game, Overwatch 2 is largely just an expansion of the original game. Blizzard has spent years trying to explain what the "2" actually means in Overwatch 2, causing confusion and frustration (opens in new tab). Skepticism about the need for Overwatch 2 intensified in the weeks leading up to launch, as Blizzard made detailed changes that players of the original Overwatch were said to dislike, such as locking new characters (opens in new tab) behind battle passes, introducing expensive cosmetic packs and demanding for new accounts to unlock old characters within 100 games (opens in new tab) The bad news and the general online dislike of Activision led many to call it a "dead game" even before its release. It turns out that a lot of people are playing Overwatch 2, even surpassing the original game's peaks. As we've seen with the relaunch of other pre-paid games like Rocket League (Opens in a new tab) and Fall Guys (Opens in a new tab), there's a lot of free stuff. I won't speak for all 25 million of us, but my friends and I were excited about the big design change that had us all excited when we first heard about it - 5 out of 5 is pretty damn good, and the same goes for it. for the new card. push mode and new characters. Our reviewer Tyler Kolp is more critical (opens in new tab) calling Overwatch 2 thus far a sequel that tries to destroy one of the best shooters of the last decade. Nokleby, who has left the company, said Lily AI has long been able to handle the home system, but that is no longer the case. And he said while some MLOps systems can manage more models, they may not have required features such as robust data visualization capabilities or the ability to work in an environment instead of a cloud Sowmya Chocka Narayanan, CTO and co-founder of Lily AI said last week : "We're still looking." learning practitioners interviewed by Protocol for this story say they can't find what they need in off-the-shelf MLOps systems. This is the biggest gap in the tech industry right now," said Nicola Morini Bianzino, EY's global director of client technology. He said the accounting firm had implemented thousands of models used for its clients' tax returns and other purposes, but had not found a suitable system to manage the various "It really surprises me. No big company has made it into this space because the opportunities are huge," said Morini Bianzino. Depending on how it's defined, forecasts for the global market for MLOps platforms range from 3 billion USD by 2027 to USD 4 billion by 2025 and USD 6 billion by 2028. Among the companies that will do MLOps - Sales platforms for building and managing machine learning models, tech giants such as Amazon, Google, Microsoft and IBM, as well as lesser known vendors such as Comet, Cloudera, DataRobot and Domino Data Lab The platforms available today are "extremely valuable," said Danny Lange, vice CEO of Artificial Intelligence and Machine Learning, in games and automotive AI from Unity "No one is doing it at the level you want right now. It's actually a difficult subject." Unity currently uses a custom system to manage thousands of deployed ML models, Lange said. For example, banking giant DBS had to build in-house to handle data analytics and the more than 400 ML models it supports for personalized banking, said Sameer Gupta, group director of analytics and managing director. "When DBS started its journey a few years ago, the solutions available in the market were mainly focused on AI/ML activities as experiments and were not aligned. our requirements for rapid iteration and operationalization," Gupta told Protocol. "We had to use the available resources to expand our internal capabilities, which allows us to better align our solutions across the bank." The company has its own internal analytics and AI platform. , which has an operational data set for managing Acquisition, Computation, Storage and Modeling, and an analytics cluster that allows data scientists to experiment and develop new tools before they go into production Intuit has also developed its own systems to build and monitor the large number of machine learning models it uses in production, including models tailored to each QuickBooks customer. Sometimes the differences between each model are minimal—one company may label certain types of purchases as "office supplies," while another company may categorize them, for example, by the name of the retailer of choice. The model should account for these differences. "We basically make models that are personalized for each [customer]," he says if Diane Chan, director of data analytics at Intuit. "When you look at it, each of these individual models that we've built outnumbers millions of ours." Intuit deployed MLOps systems before many vendors sold out to manage machine learning," said Brett Hollman, director of machine learning product design and development at Intuit. For example, Hallman said the company built a platform to manage machine learning features from scratch. "A feature set can help train a new model. If someone builds good features for cash flow, another person who does other cash flows can come along and say, "Well, this feature set really fits my use case." in an effort to encourage reuse," he said. Open or closed For companies that have been forced to do their jobs, building these machines isn't necessarily about forging parts from raw materials itself. DBS includes open source coding and application security tools such as Nexus, Jenkins, BitBucket and Confluence to ensure seamless integration and delivery of machine learning models, Gupta said. Intuit also uses open source tools or components sold by vendors to improve existing internal systems or solve a specific problem, Hollman said. However, he emphasized selectivity need in choosing a route. "A vendor may not have all the capabilities we need. Looking at an open source solution and extending an open source solution might be a better way to go to a specific component than to go to a vendor," he said. "If you're working with a vendor, you're managing their roadmap, working with them, and following their roadmap, but you're depending on their roadmap, not your internal software development lifecycle." The old "build or buy" question is the wrong one, says Zoe Hillenmeyer, chief commercial officer at Peak, which sells an AI decision-making platform and related services. Regarding MLOps, she said, "There is a false dichotomy between building and buying. This is the wrong strategy. I think the best AI would be to build and buy." If you go with a supplier, you're guiding them, working with them, and leading their way, but you rely on their roadmap, not your internal software development lifecycle." However, ensuring consistency throughout the machine learning lifecycle, from model training to deployment and monitoring, becomes increasingly difficult as companies embrace open source or vendor-provided options. Machine learning components," said John Thomas, vice president and distinguished engineer at IBM. "A company can try to force everyone to use one development platform. The reality is that most people aren't there, so you have a lot of different tools. People argue about it—it's a religious thing," Thomas said. "New" for IBM. Lack of engineering talent Companies trying to find suitable MLOps platforms also face another big challenge: finding engineering talent. "Many companies don't have software engineers with the knowledge needed to develop systems that can process large numbers of models or handle millions of decision requests in a fraction of a second," said Abhishek Gupta, founder and principal investigator at AI Ethics in Montreal. Institute and senior research associate, CEO and AI expert at Boston Consulting Group , "A lot of these places that are trying to do this are just not tech or tech companies." BCG's Gupta said. First, small companies are competing for talent with big tech companies that offer higher salaries and better resources. "There's a lack of tech talent that greatly hinders the implementation of scalable MLOps systems because this knowledge is locked in these techno in logic companies," he said. Despite the hurdles, Intuit's Hallman said it makes sense for companies that have moved on to more sophisticated machine learning efforts to build their own. "If you've been doing AI for a long time, and advanced and doing things that are at the forefront of artificial intelligence, so you've created your own solutions to do some of these things," he said. Hollman said that for companies with less advanced AI operations, buying into the marketplace of the existing MLOps platform might be good enough. "If you're new to machine learning, these platforms are the best place to start. You will have a peanut soup experience," he said. "Trying to build your own ML platform from scratch is a big commitment."
